COMPUTER SCIENCE AND ENGINEERING

CERTIFICATE

This is certify that the mini project based report entitled "**TALENTLENS 2040: AI-POWERED INTELLIGENT RECRUITMENT AND RESUME SCREENING SYSTEM**" is a bonafide work done and submitted by **Sanjana Nannapaneni – 2420030651, Vivek – 2420030018, Naman – 2420030389** in partial fulfillment of the requirements for the award of the degree of **BACHELOR OF TECHNOLOGY** in Department of Computer Science and Engineering, K L (Deemed to be University), during the academic year **2026-2027.**

Signature of the Guide

Signature of the Course Coordinator **Signature of the HOD**

ACKNOWLEDGEMENT

The success in this project would not have been possible but for the timely help and guidance rendered by many people. Our wish to express my sincere thanks to all those who has assisted us in one way or the other for the completion of my project.

Our greatest appreciation to my Course Coordinator **XXXXXXXXXXXXXXX**, and my guide **Dr.N.Sunanda,** Department of Computer Science and Engineering which cannot be expressed in words for his/her tremendous support, encouragement and guidance for this project.

We express our gratitude to **Dr.P.Venkateswara Rao**, Head of the ***Department for Computer Science and Engineering*** for providing us with adequate facilities, ways and means by which we are able to complete this project-based Lab.

We thank all the members of teaching and non-teaching staff members, and also who have assisted me directly or indirectly for successful completion of this project. Finally, I sincerely thank my parents, friends and classmates for their kind help and cooperation during my work.

Sanjana Nannapaneni – 2420030651

Vivek – 2420030018

Naman – 2420030489

Abstract

The recruitment process plays a vital role in identifying and selecting suitable candidates for job opportunities. However, traditional recruitment methods often involve manually reviewing large numbers of resumes, which can be time-consuming, repetitive, and challenging for recruiters. As the number of job applications increases, identifying candidates whose qualifications and skills match specific job requirements becomes increasingly difficult. To address these challenges, TalentLens 2040: AI-Powered Intelligent Recruitment and Resume Screening System is proposed as a technology-driven solution for simplifying and improving the initial stages of recruitment.

TalentLens 2040 is a web-based application designed to assist recruiters in screening resumes based on job descriptions and selected skill requirements. The system allows recruiters to enter job details, specify required skills, and upload candidate resumes in supported formats such as PDF, DOCX, and TXT. The backend, developed using Python and FastAPI, extracts relevant text from uploaded resumes and analyzes it against the selected job requirements. The system then generates candidate matching scores and highlights relevant skills to help recruiters compare applicants more efficiently.

The application supports a local keyword-based matching approach and an optional AI-powered contextual matching feature through the OpenAI API when configured. This combination provides flexibility in evaluating candidate information according to the available configuration. The system presents screening results through a user-friendly dashboard, helping recruiters organize and review candidate profiles.

TalentLens 2040 aims to reduce manual screening effort, improve the consistency of preliminary resume evaluation, and support faster recruitment decisions. The generated scores are intended to assist recruiters rather than replace human judgment. Final candidate selection remains the responsibility of the recruiter, ensuring that the system functions as a decision-support tool in the recruitment process.

CHAPTER 1

Introduction

1.1 Motivation

Recruitment is an important process for every organization because selecting suitable candidates plays a major role in achieving organizational goals. Traditionally, recruiters manually examine resumes, compare candidate qualifications with job requirements, and shortlist applicants for further selection. When organizations receive a large number of applications, this process becomes time-consuming, repetitive, and difficult to manage efficiently. The increasing use of digital technologies and artificial intelligence has created opportunities to improve recruitment activities. Automated resume screening can help recruiters identify relevant skills, qualifications, and experience more efficiently. This motivated the development of TalentLens 2040: AI-Powered Intelligent Recruitment and Resume Screening System.

The main motivation behind this project is to simplify the initial resume-screening process by providing a platform where recruiters can enter job requirements, select important skills, upload candidate resumes, and view matching results. The system aims to reduce manual effort, support consistent preliminary evaluation, and help recruiters make more informed shortlisting decisions.

1.2 Objective

The primary objective of TalentLens 2040 is to develop a web-based intelligent recruitment and resume-screening system that assists recruiters in identifying candidates whose profiles match specific job requirements.

The major objectives of the project are:

•To provide a user-friendly platform for recruiters to enter job titles and job descriptions.

•To allow recruiters to select required skills based on the requirements of a particular job.

•To support resume uploads in PDF, DOCX, and TXT formats.

•To extract relevant information and skills from uploaded resumes.

•To compare candidate resume information with the selected job requirements.

•To generate candidate matching scores and highlight relevant skills.

•To provide keyword-based screening and optional AI-powered contextual matching.

•To display screening results through an organized dashboard for easier candidate comparison.

•To reduce the time and manual effort involved in preliminary resume screening.

The system is designed as a decision-support tool. It assists recruiters during the initial screening stage but does not replace human judgment or make final hiring decisions.

1.3 What is Web Development?

Web development refers to the process of creating, building, and maintaining websites and web applications that operate over the Internet or an intranet. It includes activities such as web designing, programming, content development, database integration, and server-side configuration.

Web development can range from creating a simple static webpage to developing complex web-based applications that support dynamic content, user interaction, and data processing. Modern web applications are commonly developed using technologies such as HTML, CSS, JavaScript, and programming languages such as Python.

Web development is generally divided into three major areas:

1. Front-End Development:

Front-end development focuses on the visual and interactive parts of a website that users can see and access through a web browser. It involves designing layouts, navigation, forms, buttons, and dashboards using technologies such as HTML, CSS, and JavaScript.

2. Back-End Development:

Back-end development focuses on the server-side operations of a web application. It handles application logic, data processing, file handling, and communication between the frontend and backend. In TalentLens 2040, Python and the FastAPI framework are used to implement backend functionality.

3. Full-Stack Development:

Full-stack development combines both frontend and backend development. A full-stack application provides a complete solution by connecting the user interface with server-side processing and other application services.

Web development plays an important role in TalentLens 2040 because it provides an accessible interface through which recruiters can upload resumes, define job requirements, and view screening results.

1.4 What is Website?

A website is a collection of related web pages and digital resources that are generally available through a common domain name and hosted on a web server. Websites can contain text, images, videos, forms, interactive elements, and other multimedia content.

Websites are accessed through web browsers using a Uniform Resource Locator (URL). They can be developed for different purposes, including education, business, communication, entertainment, information sharing, and online services.

Websites are generally classified into two main types:

1. Static Website:

A static website displays fixed content to visitors. The information usually remains the same unless the website files are manually updated.

2. Dynamic Website:

A dynamic website can display changing content and respond to user interactions. It may communicate with a backend server to process information and generate results.

TalentLens 2040 is developed as a web-based application that provides an interactive interface for recruiters. Users can enter job details, select required skills, upload resumes, and view the screening results through the application.

1.5 What is Webpage?

A webpage is an individual document or resource available on the World Wide Web. It is usually displayed through a web browser and may contain text, images, links, forms, tables, and interactive components.

Webpages are commonly created using HyperText Markup Language (HTML), while Cascading Style Sheets (CSS) are used to control their appearance and layout. JavaScript is used to add interactive functionality, such as responding to user actions, validating form inputs, and updating webpage content.

A website may contain multiple interconnected webpages that serve different purposes. For example, a website may include a home page, login page, dashboard, profile page, and contact page.

In TalentLens 2040, the webpage acts as the main interaction point between the recruiter and the application. It provides the interface for entering job descriptions, selecting required skills, uploading candidate resumes, and viewing matching scores and screening information. The webpage communicates with the FastAPI backend to process uploaded files and return screening results.

CHAPTER 2

Software Requirement

2.1 Problem Statement

The recruitment process involves evaluating a large number of resumes to identify candidates who meet the requirements of a particular job. Traditional manual screening requires recruiters to read resumes individually, identify relevant skills, and compare candidate qualifications with job descriptions. This process can consume significant time and effort, especially when organizations receive hundreds or thousands of applications.

Manual resume screening can also make it difficult to maintain consistency when evaluating candidates against multiple job requirements. Important skills and qualifications may be overlooked because of the volume of applications and repetitive nature of the task.

To address these challenges, TalentLens 2040: AI-Powered Intelligent Recruitment and Resume Screening System is developed as a web-based application that assists recruiters in the preliminary screening of resumes. The system allows recruiters to provide job descriptions, select required skills, and upload resumes. It extracts relevant text from the uploaded documents, compares the information with the selected requirements, and generates candidate matching scores.

The proposed system aims to reduce manual screening effort, organize candidate information, and support recruiters in identifying potentially suitable applicants more efficiently. The final recruitment decision remains with the recruiter..

2.2 Technologies used

The following technologies are used in the development of TalentLens 2040.

1. HTML (HyperText Markup Language)

HTML is the standard markup language used to create and structure webpages. It defines the elements displayed in a web browser, including headings, paragraphs, forms, buttons, tables, and other webpage components.

HTML provides the basic structure of the TalentLens 2040 application. It is used to create the recruiter interface, job requirement section, resume upload area, and candidate screening results.

General Syntax of HTML:

```
<!DOCTYPE html>

<html>

<head>

  <title>TalentLens 2040</title>

</head>

<body>

  <h1>TalentLens 2040</h1>

  <p>AI-Powered Intelligent Recruitment System</p>

</body>

</html>
```

2. CSS (Cascading Style Sheets)

CSS is a stylesheet language used to control the appearance and layout of webpages written in HTML. It defines properties such as colors, fonts, spacing, borders, backgrounds, and element positioning.

CSS helps create an attractive, organized, and responsive user interface. In TalentLens 2040, it is used to style the dashboard, navigation elements, resume upload section, skill selection area, buttons, and candidate result displays.

Types of CSS:

1. Inline CSS:

Inline CSS is written directly inside an HTML element using the style attribute. It is used when a style needs to be applied to a specific element.

2. Internal CSS:

Internal CSS is written inside the <style> tag within the HTML document's <head> section. It is useful when styles are required for a single webpage.

3. External CSS:

External CSS is written in a separate .css file and linked to an HTML document. It helps maintain consistent styling across multiple webpages and makes the code easier to manage.

3. JavaScript

JavaScript is a programming language used to make webpages interactive and dynamic. It allows developers to respond to user actions, validate input, update webpage content, and communicate with backend services.

In TalentLens 2040, JavaScript is used to manage interactive elements such as skill selection, resume upload interactions, form handling, and displaying screening results. It also helps send user-provided information to the backend and update the interface with the returned results.

4. Python

Python is a high-level, general-purpose programming language known for its readable syntax and extensive libraries. It is commonly used in web development, automation, data processing, and artificial intelligence applications.

In TalentLens 2040, Python is used to implement the backend functionality. It handles uploaded resume files, extracts text, processes job requirements, and performs the matching operations required for preliminary resume screening.

5. FastAPI

FastAPI is a modern Python web framework used to develop APIs. It supports asynchronous operations, request validation, and automatic API documentation.

In TalentLens 2040, FastAPI is used to build the backend server. It receives job details and uploaded resumes from the frontend, processes the information, performs resume matching, and returns the screening results to the user interface.

6. OpenAI API (Optional AI Integration)

The OpenAI API provides access to AI models that can process and understand text. It can be integrated into applications to perform tasks such as text analysis, summarization, and contextual evaluation.

TalentLens 2040 supports optional AI-powered contextual matching through the OpenAI API. When the API is configured, the system can use the extracted resume information and job requirements to generate contextual matching

results. If the API is not configured, the application uses its local keyword-based matching approach.

7. Resume Processing Libraries

Resume processing libraries are used to extract text from different document formats. TalentLens 2040 supports resume uploads in PDF, DOCX, and TXT formats.

These files are processed by the backend to obtain text that can be compared with job descriptions and selected skills. The extracted information is then used during the candidate matching process.

2.3 Software Used

2.3.1 Visual Studio Code (Text Editor)

Visual Studio Code (VS Code) is a source-code editor developed by Microsoft. It supports multiple programming languages and provides features such as syntax highlighting, debugging, extensions, and an integrated terminal.

VS Code is used as the development environment for TalentLens 2040. It allows developers to write and manage HTML, CSS, JavaScript, and Python code within a single application. Its integrated terminal is also useful for installing project dependencies and running the FastAPI development server.

2.3.2 Python Environment

Python is used to execute the backend application. The Python environment provides the runtime required to run the FastAPI server and the libraries used for resume processing and matching.

Project dependencies are installed using Python's package management tool, pip, with the help of the requirements.txt file.

2.3.3 Web Browser

A web browser is used to access and interact with the TalentLens 2040 application. It displays the frontend interface and allows recruiters to enter job requirements, select skills, upload resumes, and view screening results.

The application can be accessed locally through the browser using the development server address:

http://127.0.0.1:8002

2.3.4 Uvicorn Server

Uvicorn is an ASGI server used to run Python web applications, including applications developed with FastAPI.

In TalentLens 2040, Uvicorn runs the FastAPI backend and makes the application accessible through a local web address. During development, the server is configured to use port 8002.

CHAPTER 3

Software Design

3.1 Data Flow Diaram(DFD)

A Data Flow Diagram (DFD) is a graphical representation of how data moves through a system or application. It illustrates the flow of information between external entities, processes, and data stores. A DFD helps to understand the inputs, processing activities, and outputs of a system.

A Data Flow Diagram represents how information enters a system, how it is processed, and how the resulting information is provided to users. It focuses on the movement of data rather than the control flow or decision-making logic of the application.

In TalentLens 2040: AI-Powered Intelligent Recruitment and Resume Screening System, the Data Flow Diagram represents the interaction between the recruiter and the resume-screening application. The recruiter provides job details, selects required skills, and uploads candidate resumes. The system extracts resume information, compares it with the job requirements, and generates matching scores and screening results..

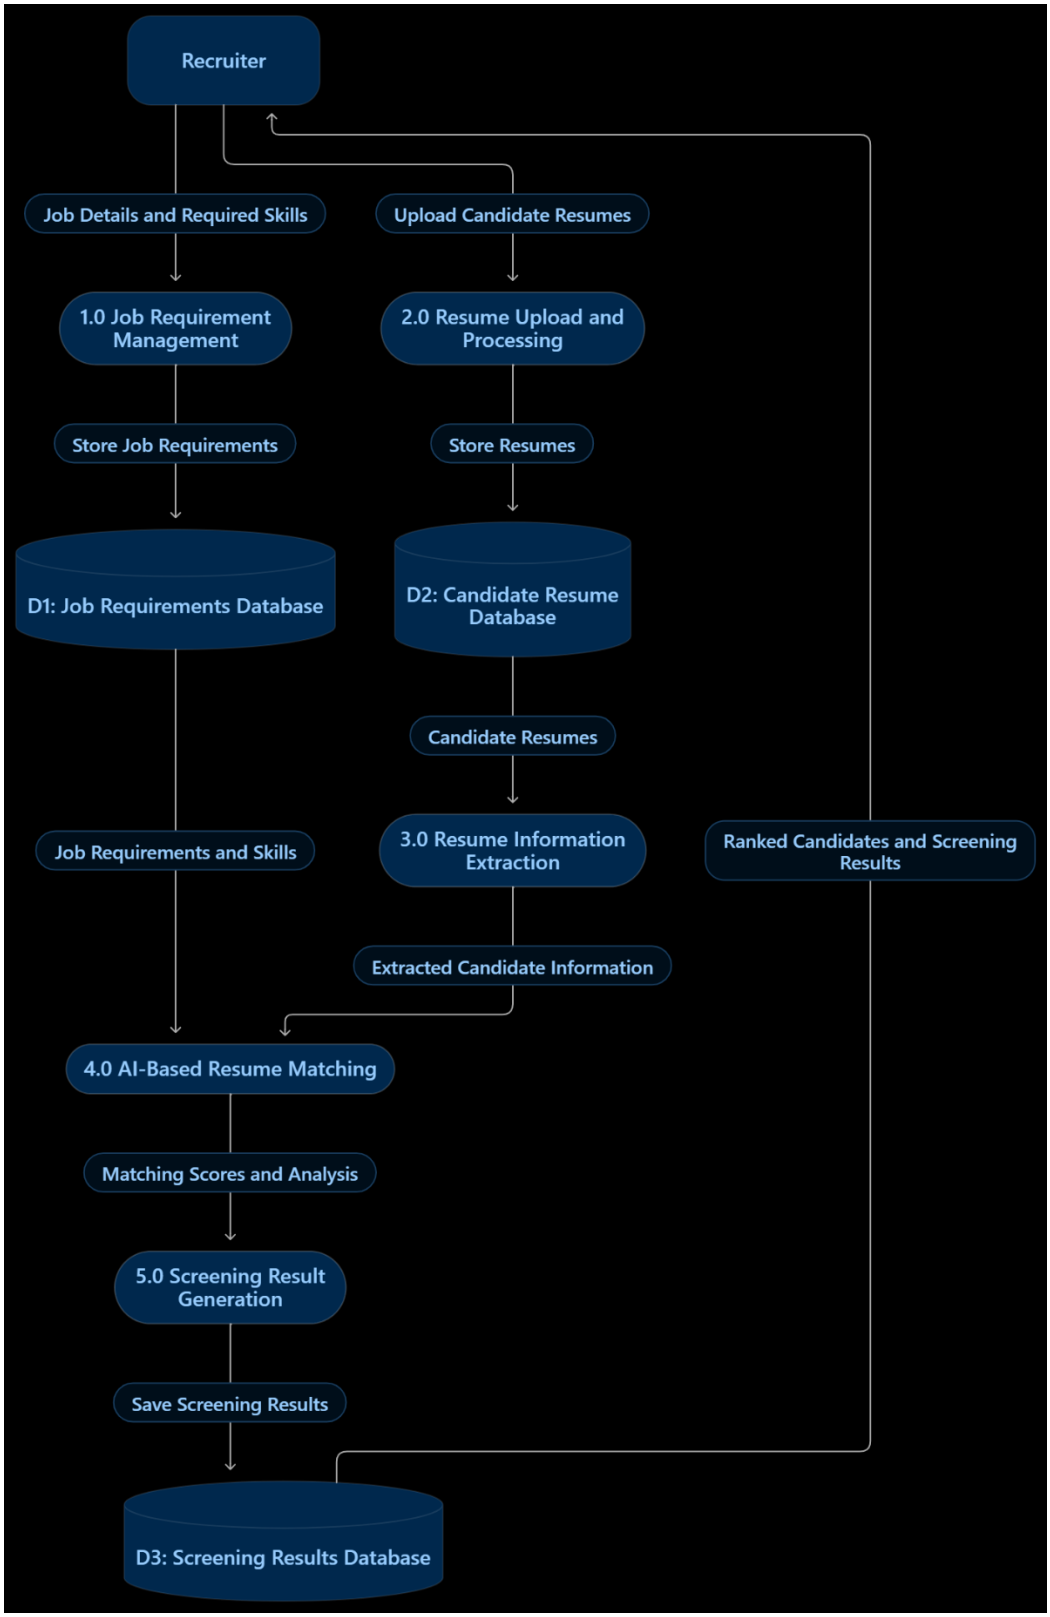

Fig No. 3.1 DFD LEVEL-0

3.1.1 DFD Level 0 (Context Diagram)

The Level-0 DFD provides a high-level overview of the TalentLens 2040 system. It represents the entire application as a single process and shows the interaction between the external user and the system.

External Entity:

- Recruiter: Provides job descriptions, selects required skills, and uploads candidate resumes.

Main Process:

- TalentLens 2040 Resume Screening System: Receives the input, extracts resume text, analyzes candidate information, and compares it with job requirements.

Inputs:

- Job title and job description.
- Selected required skills.
- Candidate resume files.

Outputs:

- Candidate matching scores.
- Identified matching skills.
- Resume screening results.

3.1.2 DFD Level 1

The Level-1 DFD provides a more detailed representation of the internal processes of the TalentLens 2040 application.

The major processes are:

1.Enter Job Requirements: The recruiter enters the job title and job description.

2.Select Required Skills: The recruiter selects the skills required for the particular job.

3.Upload Resumes: The recruiter uploads candidate resumes in supported formats such as PDF, DOCX, and TXT.

4.Extract Resume Information: The backend extracts text from the uploaded resume files.

5.Analyze and Match: The system compares extracted resume information with the job description and selected skills using keyword-based matching or optional AI-powered contextual matching.

6.Display Results: The system generates matching scores and displays relevant screening information to the recruiter.

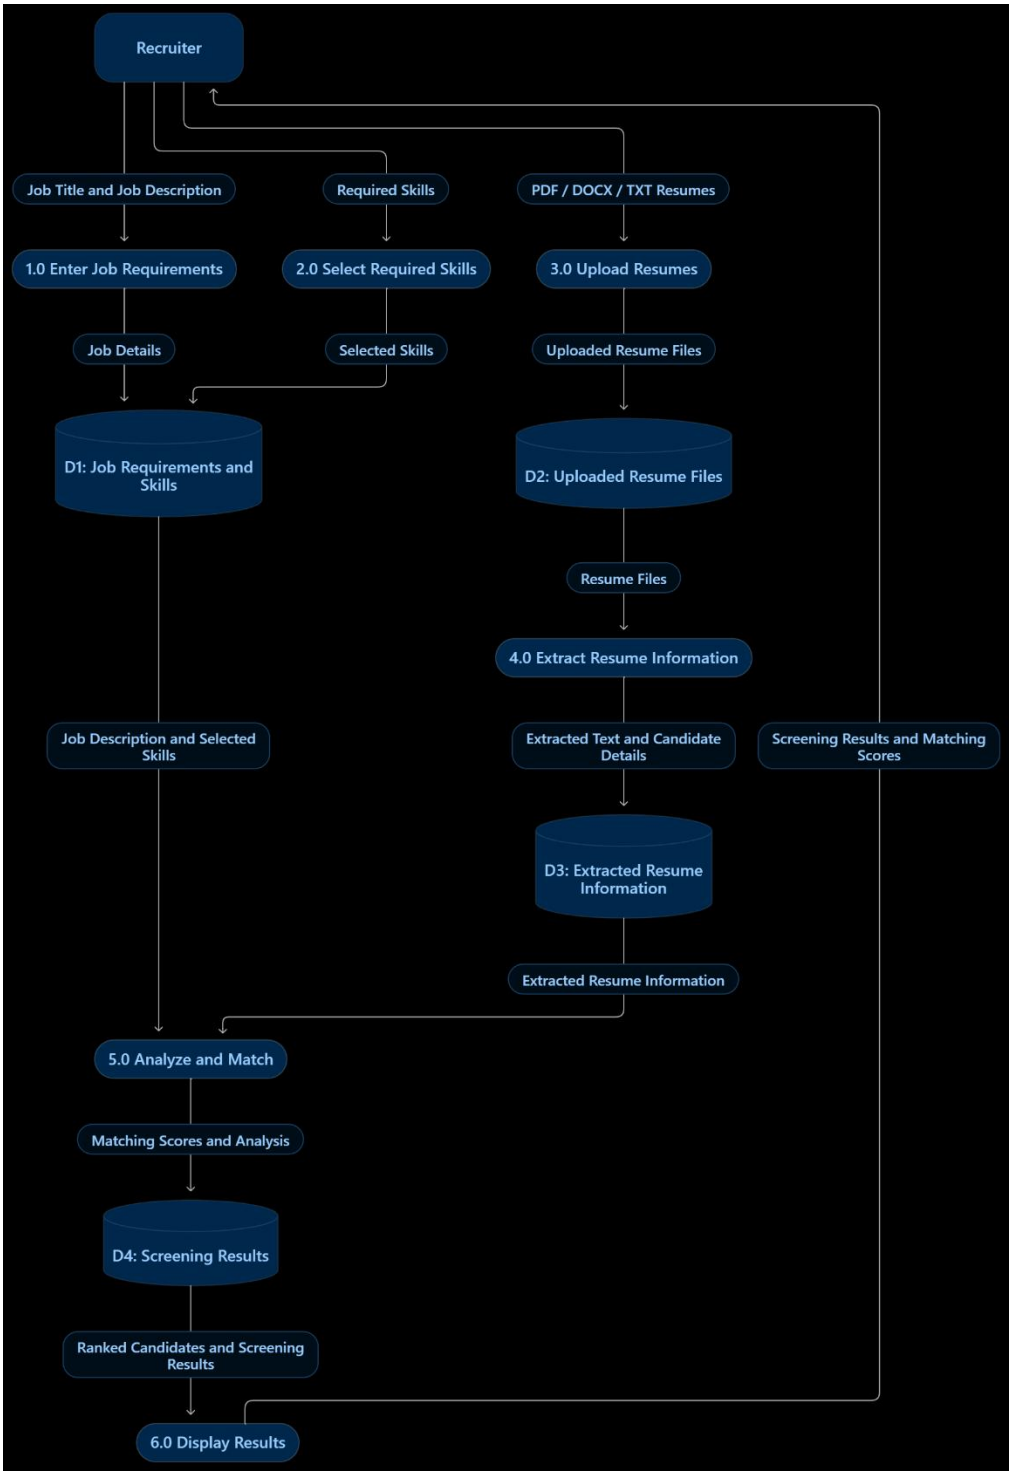

Fig. No. 3.2: DFD Level-1 – Internal Processes of TalentLens 2040

CHAPTER 4

Implementation and User Interface

4.1 Web Page Details

TalentLens 2040 provides a user-friendly web interface that allows recruiters to perform preliminary resume screening. The application contains the following major interface sections:

1. Home Page / Dashboard
2. Job Description and Requirements Section
3. Required Skills Selection Section
4. Resume Upload Section
5. Candidate Screening Results Section**4.2 Detailed Description of**

4.2 Detailed Description of Pages

1. Home Page / Dashboard

The home page is the main interface of the TalentLens 2040 application. It provides an overview of the intelligent recruitment and resume-screening system. The dashboard introduces the purpose of the application and provides access to the main screening features.

The recruiter can use this page to begin the resume-screening process by entering job requirements, selecting required skills, and uploading candidate resumes. The interface is designed to make the recruitment process simple and convenient.

Fig. No. 4.1: TalentLens 2040 Home Page / Dashboard

2. Job Description and Requirements Section

This section allows recruiters to provide information about the job vacancy. The recruiter can enter the job title and job **description,**

including the responsibilities and qualifications expected from candidates.

The provided job information acts as the reference for evaluating uploaded resumes. The system uses these requirements during the matching process to identify candidates whose resume content is relevant to the job.

Fig. No. 4.2: Job Description and Requirements Section

3. Required Skills Selection Section

The required skills section allows recruiters to select the important technical and professional skills needed for a particular job role. The application provides suggested skills that can be selected using checkboxes. Recruiters can also enter additional custom skills according to their requirements.

The selected skills are considered during resume matching. This feature helps recruiters customize the screening criteria for different job positions instead of relying only on general resume information.

Fig. No. 4.3: Required Skills Selection Section

4. Resume Upload Section

The resume upload section allows recruiters to upload candidate resumes for screening. The application supports PDF, DOCX, and TXT file formats.

After the files are uploaded, the backend extracts the text content from the resumes. The extracted information is then processed and compared with the job description and selected skills.

This functionality reduces the need for recruiters to manually read every resume during the initial screening stage.

Fig. No. 4.4: Resume Upload Section

5. Candidate Screening Results Section

The candidate screening results section displays the results generated after processing the uploaded resumes. The application presents candidate matching scores and relevant skill information to help recruiters understand how closely each resume matches the job requirements.

The system uses keyword-based matching by default and can support optional AI-powered contextual matching when the OpenAI API is configured.

Recruiters can review the displayed results and use them to identify candidates who may be suitable for further evaluation. The matching score is an assistance measure and should not be treated as a guarantee of candidate suitability. Final selection decisions are made by the recruiter.

Fig. No. 4.5: Candidate Screening Results Dashboard

CHAPTER 5

Conclusion and Future Aspects

5.1 Conclusion

We have successfully developed TalentLens 2040: AI-Powered Intelligent Recruitment and Resume Screening System, a web-based application designed to simplify the preliminary recruitment and resume-screening process. The system provides recruiters with a platform to enter job descriptions, select required skills, and upload candidate resumes in supported formats such as PDF, DOCX, and TXT.

With the help of Python, FastAPI, HTML, CSS, and JavaScript, we have developed an application that extracts information from uploaded resumes and compares it with the specified job requirements. The system generates candidate matching scores and highlights relevant skills, helping recruiters identify potentially suitable applicants more efficiently.

The application supports keyword-based matching and optional AI-powered contextual matching through the OpenAI API when configured. Its user-friendly interface makes the screening process easier to understand and operate.

Overall, TalentLens 2040 aims to reduce the manual effort involved in initial resume screening, improve the organization of candidate information, and support recruiters in making informed shortlisting decisions. Although the system assists in evaluating resumes, final recruitment decisions remain with human recruiters.

5.2 Future Aspects

The following features can be added in future versions to improve the functionality and effectiveness of TalentLens 2040:

1. Database Integration:

A database can be integrated to store candidate profiles, uploaded resume information, job descriptions, and screening results for future reference.

2. Recruiter Authentication:

A secure login and registration system can be introduced to provide individual recruiter accounts and protect recruitment-related information.

3. Advanced AI-Based Resume Analysis:

More advanced AI and machine-learning techniques can be integrated to improve contextual understanding of candidate experience, qualifications, and job requirements.

4. Candidate Ranking and Filtering:

The system can provide advanced sorting and filtering options based on matching scores, required skills, experience, and qualifications.

5. Resume Feedback and Recommendations:

The application can provide candidates with suggestions for improving their resumes by identifying missing skills and areas that could be strengthened.

6. Interview Scheduling:

An interview scheduling feature can be introduced to help recruiters coordinate interview dates and communicate with shortlisted candidates.

7. Email and Notification Integration:

Email or notification services can be added to inform candidates about application status, interview schedules, and recruitment updates.

8. Enhanced Security and Privacy:

Additional security features, access controls, secure file handling, and data protection mechanisms can be implemented to protect sensitive candidate information.

These future enhancements can make TalentLens 2040 a more comprehensive recruitment-support platform.

7.5 Description About the Page

```
<div class="container">
    <div class="row">
      <div class="col-md-12">
          <div class="description">
             <h5><p>
            Analysis connect people with great local Bussiness. Food Analysis centre help potential customers weed out their choices. Reviews help them decide if they’re going to stop into your restaurant or the competition’s.
            This Website ultimately rely on their users to post reviews, which can be rather subjective and not entirely accurate. Moreover, negative and inflammatory reviews tend to attract significantly more attention than positive review. For example, if a restaurant gets 10 positive reviews and just 1 negative review, most people will often scroll down to the negative review and read what it says. This means that even a single bad review can put a business in a bad light. This can pollute their online presence and potentially cause some loss in revenue.
             This is why restaurant owners must make it a point to manage their reputation effectively and focus on customer service as much as the quality of food. Good social presence on the Internet also helps with this. As you can see, running a restaurant is no less effort than running any other business. In fact, it arguably involves more work due to its hands-on nature and its volatility.
             So,with the help of this website the potential customers weed out their choices of Restaurant in Mathura.
          </p>
        </h5>
